Modules LED

Lampade a LED per acquario

TESZLA
QUAZAR

Power supply unit

First of all connect the power supply unit to the lamp socket (Fig.6–A). The supply cable should form a drip loop between the lamp and the power supply unit so that drip water does not enter the power supply unit. The mains plug for the external power supply unit should then be plugged into the socket.

NB: powering down the Teszla/Teszla-XT for a duration longer than 3 seconds will reset the unit to default, requiring reprogramming of any intensities and sunrise/sunset Schedules that were previously stored. A small amount of residual current is stored in the lamp allowing the unit to retain programming in the event of intermittent power shortages etc.

The direct current connection between the power supply unit and the lamp must not be modified in any way. Attempts to interfere with this connection with regulators or similar devices will lead to immediate loss of warranty.

Installation

Unsecured installation: The QUAZAR light module is the only module that can be placed on a transparent plastic or glass aquarium cover without being secured.

Installing TESZLA by means of steel-wire suspension (Fig.1, product no. 20.300.013): Remove both screw caps in the protective glass at the top of the lamp. Screw both light hangers (5) for the optional TESZLA steel-wire suspension **finger tight** using the M4 set screws.

Install the ceiling mounting (2) with suitable screws and dowels (1) and make sure that the stonework guarantees sufficient on-site support. In some cases special fastening systems, such as cavity fixing dowels, hasp screws etc may be necessary. If in doubt, especially with special ceiling systems please consult a specialist. Now feed the steel-wire (4) into the drilled hole in the screw-plug (3). Screw this into the ceiling mounting (2). Guide the end of the steel-wire into the light hanger drilled hole (5). Make sure the light hanger is secured firmly. As your lamp is fully adjustable for height it can be locked in place easily by pressing the spring mechanism nozzle. For safety reasons the lamp must be raised slightly prior to adjustment. When pressure is then exerted on the light hanger the lamp is locked in place automatically. Now align your aquarium lamp horizontally over the tank.

Installing the QUAZAR with the mounting brackets (Fig.2+3) The Quazar can be mounted beneath aquarium covers, racks or other materials using the mounting brackets supplied with it. Insert a suitable screw (not provided) into the bracket hole and attach the bracket at the desired location. Now clamp the light module into the mounting brackets and adjust if necessary. If using several modules, the mounting brackets may be installed adjacent to one another on an aluminium angle bracket to create a complete lighting system.

The mounting brackets can be fitted with height adjustment and wire suspension (Fig. 1+4) using the optional steel-wire suspension system (product no. 20.300.013-1) and two M4 screws. The lamp can then be hung from the ceiling or e.g. a wall bracket.

Installing the TESZLA LED module with aquarium brackets (product no. 20.171.031): First of all remove both screws from the rear of the lamp and attach the optional TESZLA aquarium bracket to the rear of the lamp using these screws. Attach the foot of the aquarium bracket to the rear edge of the tank and secure the aquarium bracket to the aquarium using the retention screws. Alternatively, the TESZLA aquarium bracket may be attached directly to the wall using suitable screws (not provided).
